Look for a matrix that has row sums 4 and 8, and column sums 2 and s: 26

Matrix = $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ $\begin{array}{c} a+b=4 & a+c=2 \\ c+d=8 & b+d=s \end{array}$

The four equations are solvable only if s =_____. Then find two different matrices that have the correct row and column sums. Extra credit: Write down the 4 by 4 system Ax = b with x = (a, b, c, d) and make A triangular by elimination.

$$A = \begin{bmatrix} 1 & 1 & 0 \\ 4 & 6 & 1 \\ -2 & 2 & 0 \end{bmatrix} \text{ and } E_{32}E_{31}E_{21}A = U.$$

Multiply those E's to get one matrix M that does elimination: MA = U.

$$A\mathbf{x} = \begin{bmatrix} 2 & 3\\ 4 & 1 \end{bmatrix} \begin{bmatrix} x_1\\ x_2 \end{bmatrix} = \begin{bmatrix} 1\\ 17 \end{bmatrix}.$$

Apply elimination to the 3 by 4 augmented matrix $\begin{bmatrix} A & b \end{bmatrix}$. How do you know this 25 system has no solution? Change the last number 6 so there is a solution.

29 Find the triangular matrix E that reduces "*Pascal's matrix*" to a smaller Pascal:

Which matrix M (multiplying several E's) reduces Pascal all the way to I? Pascal's triangular matrix is exceptional, all of its multipliers are $\ell_{ij} = 1$.

30 Write $M = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix}$ as a product of many factors $A = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$.

- (a) What matrix E subtracts row 1 from row 2 to make row 2 of EM smaller?
- (b) What matrix F subtracts row 2 of EM from row 1 to reduce row 1 of FEM?
- (c) Continue E's and F's until (many E's and F's) times (M) is (A or B).
- (d) E and F are the inverses of A and B! Moving all E's and F's to the right side will give you the desired result M = product of A's and B's.

This is possible for integer matrices $M = \begin{bmatrix} a & b \\ c & d \end{bmatrix} > 0$ that have ad - bc = 1.

31 Find elimination matrices E_{21} then E_{32} then E_{43} to change K into U:

$$E_{43} E_{32} E_{21} \begin{bmatrix} 2 & -1 & 0 & 0 \\ -1 & 2 & -1 & 0 \\ 0 & -1 & 2 & -1 \\ 0 & 0 & -1 & 2 \end{bmatrix} = \begin{bmatrix} 2 & -1 & 0 & 0 \\ 0 & 3/2 & -1 & 0 \\ 0 & 0 & 4/3 & -1 \\ 0 & 0 & 0 & 5/4 \end{bmatrix}.$$

Apply those three steps to the identity matrix I, to multiply $E_{43}E_{32}E_{21}$.

2.4. Rules for Matrix Operations

The 3-step paths are counted by A^3 ; we look at paths to node 2:

$$A^{3} = \begin{bmatrix} 3 & 2 \\ 2 & 1 \end{bmatrix} \quad \text{counts the paths} \quad \begin{bmatrix} \cdots & 1 \text{ to } 1 \text{ to } 2, 1 \text{ to } 2 \text{ to } 1 \text{ to } 2 \end{bmatrix}$$

with three steps
$$\begin{bmatrix} \cdots & 2 \text{ to } 1 \text{ to } 1 \text{ to } 2, 1 \text{ to } 2 \text{ to } 1 \text{ to } 2 \end{bmatrix}$$

These A^k contain the Fibonacci numbers $0, 1, 1, 2, 3, 5, 8, 13, \ldots$ coming in Section 6.2. Multiplying A by A^k involves Fibonacci's rule $F_{k+2} = F_{k+1} + F_k$ (as in 13 = 8 + 5):

$$(A)(A^{k}) = \begin{bmatrix} 1 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} F_{k+1} & F_{k} \\ F_{k} & F_{k-1} \end{bmatrix} = \begin{bmatrix} F_{k+2} & F_{k+1} \\ F_{k+1} & F_{k} \end{bmatrix} = A^{k+1}.$$

There are 13 six-step paths from node 1 to node 1, but I can't find them all.

 A^k also counts words. A path like 1 to 1 to 2 to 1 corresponds to the word **aaba**. The letter **b** can't repeat because there is no edge from 2 to 2. The *i*, *j* entry of A^k counts the words of length k + 1 that start with the *i*th letter and end with the *j*th.

28 Draw the cuts in A (2 by 3) and B (3 by 4) and AB to show how each of the four multiplication rules is really a block multiplication:

(1)	Matrix A times columns of B.	Columns of <i>AB</i>
-----	------------------------------	----------------------

- (2) Rows of A times the matrix B. Rows of AB
- (3) Rows of A times columns of B. Inner products (numbers in AB)

29 Which matrices E_{21} and E_{31} produce zeros in the (2, 1) and (3, 1) positions of $E_{21}A$ and $E_{31}A$?

$$A = \begin{bmatrix} 2 & 1 & 0 \\ -2 & 0 & 1 \\ 8 & 5 & 3 \end{bmatrix}$$

Find the single matrix $E = E_{31}E_{21}$ that produces both zeros at once. Multiply EA.

(Very important) Suppose you solve Ax = b for three special right sides b: 32

$$Ax_1 = \begin{bmatrix} 1\\0\\0 \end{bmatrix}$$
 and $Ax_2 = \begin{bmatrix} 0\\1\\0 \end{bmatrix}$ and $Ax_3 = \begin{bmatrix} 0\\0\\1 \end{bmatrix}$

If the three solutions x_1, x_2, x_3 are the columns of a matrix X, what is A times X?

If the three solutions in Question 32 are $x_1 = (1, 1, 1)$ and $x_2 = (0, 1, 1)$ and $x_3 = (0, 0, 1)$, solve Ax = b when b = (3, 5, 8). Challenge problem: What is A? 33

Find all matrices $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ that satisfy $A \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} A$. 34

Suppose a "circle graph" has 4 nodes connected (in both directions) by edges around a circle. What is its adjacency matrix from Worked Example 2.4 C? What is A^2 ? 35 Find all the 2-step paths (or 3-letter words) predicted by A^2 .

Challenge Problems

- **Practical question** Suppose A is m by n, B is n by p, and C is p by q. Then the multiplication count for (AB)C is mnp + mpq. The same answer comes from 36 A times BC with mnq + npq separate multiplications. Notice npq for BC.
 - (a) If A is 2 by 4, B is 4 by 7, and C is 7 by 10, do you prefer (AB)C or A(BC)?
 - (b) With *N*-component vectors, would you choose $(\boldsymbol{u}^{\mathrm{T}}\boldsymbol{v})\boldsymbol{w}^{\mathrm{T}}$ or $\boldsymbol{u}^{\mathrm{T}}(\boldsymbol{v}\boldsymbol{w}^{\mathrm{T}})$?
 - (c) Divide by mnpq to show that (AB)C is faster when $n^{-1} + q^{-1} < m^{-1} + p^{-1}$.
- To prove that (AB)C = A(BC), use the column vectors b_1, \ldots, b_n of B. First 37 suppose that C has only one column c with entries c_1, \ldots, c_n :

AB has columns Ab_1, \ldots, Ab_n and then (AB)c equals $c_1Ab_1 + \cdots + c_nAb_n$. Bc has one column $c_1 b_1 + \cdots + c_n b_n$ and then A(Bc) equals $A(c_1 b_1 + \cdots + c_n b_n)$. Linearity gives equality of those two sums. This proves (AB)c = A(Bc). The same is true for all other _____ of C. Therefore (AB)C = A(BC). Apply to inverses: If BA = I and AC = I, prove that the left-inverse B equals the right-inverse C.

Problem Set 2.5

1 Find the inverses (directly or from the 2 by 2 formula) of A, B, C:

$$A = \begin{bmatrix} 0 & 3 \\ 4 & 0 \end{bmatrix} \text{ and } B = \begin{bmatrix} 2 & 0 \\ 4 & 2 \end{bmatrix} \text{ and } C = \begin{bmatrix} 3 & 4 \\ 5 & 7 \end{bmatrix}.$$

2 For these "permutation matrices" find P^{-1} by trial and error (with 1's and 0's):

Solve for the first column (x, y) and second column (t, z) of A^{-1} :

$$\begin{bmatrix} 10 & 20 \\ 20 & 50 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix} \text{ and } \begin{bmatrix} 10 & 20 \\ 20 & 50 \end{bmatrix} \begin{bmatrix} t \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}.$$

Show that $\begin{bmatrix} 1 & 2 \\ 3 & 6 \end{bmatrix}$ is not invertible by trying to solve $AA^{-1} = I$ for column 1 of A^{-1} :

- 8 If A has column 1 + column 2 = column 3, show that A is not invertible:
 - (a) Find a nonzero solution x to Ax = 0. The matrix is 3 by 3.
 - (b) Elimination keeps column 1 + column 2 = column 3. Explain why there is no third pivot.

- There are sixteen 2 by 2 matrices whose entries are 1's and 0's. How many of them 21 are invertible?

Questions 22–28 are about the Gauss-Jordan method for calculating A^{-1} .

Change I into A^{-1} as you reduce A to I (by row operations): 22

$$\begin{bmatrix} A & I \end{bmatrix} = \begin{bmatrix} 1 & 3 & 1 & 0 \\ 2 & 7 & 0 & 1 \end{bmatrix} \text{ and } \begin{bmatrix} A & I \end{bmatrix} = \begin{bmatrix} 1 & 4 & 1 & 0 \\ 3 & 9 & 0 & 1 \end{bmatrix}$$

Follow the 3 by 3 text example but with plus signs in A. Eliminate above and below 23 the pivots to reduce $\begin{bmatrix} A & I \end{bmatrix}$ to $\begin{bmatrix} I & A^{-1} \end{bmatrix}$:

$$\begin{bmatrix} A & I \end{bmatrix} = \begin{bmatrix} 2 & 1 & 0 & 1 & 0 & 0 \\ 1 & 2 & 1 & 0 & 1 & 0 \\ 0 & 1 & 2 & 0 & 0 & 1 \end{bmatrix}.$$

True or false (with a counterexample if false and a reason if true):

(a) A 4 by 4 matrix with a row of zeros is not invertible.

(b) Every matrix with 1's down the main diagonal is invertible.

(c) If A is invertible then A^{-1} and A^2 are invertible.

30 For which three numbers c is this matrix not invertible, and why not?

$$A = \begin{bmatrix} 2 & c & c \\ c & c & c \\ 8 & 7 & c \end{bmatrix}.$$

31 Prove that A is invertible if $a \neq 0$ and $a \neq b$ (find the pivots or A^{-1}):

	Гa	b	b^{-}	Į
A =	a	а	b	
	La	а	a_{\perp}	

32 This matrix has a remarkable inverse. Find A^{-1} by elimination on $\begin{bmatrix} A & I \end{bmatrix}$. Extend to a 5 by 5 "alternating matrix" and guess its inverse; then multiply to confirm.

Invert
$$A = \begin{bmatrix} 1 & -1 & 1 & -1 \\ 0 & 1 & -1 & 1 \\ 0 & 0 & 1 & -1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
 and solve $Ax = (1, 1, 1, 1)$.

- **33** Suppose the matrices P and Q have the same rows as I but in any order. They are "permutation matrices". Show that P Q is singular by solving (P Q)x = 0.
- **34** Find and check the inverses (assuming they exist) of these block matrices:

[]	0]	$\int A$	0]	[0]	I
$\lfloor C$	I	$\lfloor C$	D	I	$\begin{bmatrix} I \\ D \end{bmatrix}$.

- **35** Could a 4 by 4 matrix A be invertible if every row contains the numbers 0, 1, 2, 3 in some order? What if every row of B contains 0, 1, 2, -3 in some order?
- 36 In the Worked Example 2.5 C, the triangular Pascal matrix L has an inverse with "alternating diagonals". Check that this L^{-1} is DLD, where the diagonal matrix D has alternating entries 1, -1, 1, -1. Then LDLD = I, so what is the inverse of LD = pascal (4,1)?
- **37** The Hilbert matrices have $H_{ij} = 1/(i + j 1)$. Ask MATLAB for the exact 6 by 6 inverse invhilb(6). Then ask it to compute inv(hilb(6)). How can these be different, when the computer never makes mistakes?
- **38** (a) Use inv(P) to invert MATLAB's 4 by 4 symmetric matrix P = pascal(4).
 - (b) Create Pascal's lower triangular L = abs(pascal(4,1)) and test $P = LL^{T}$.
- **39** If A = ones(4) and b = rand(4,1), how does MATLAB tell you that Ax = b has no solution? For the special b = ones(4,1), which solution to Ax = b is found by $A \setminus b$?

Challenge Problems

- 40 (Recommended) A is a 4 by 4 matrix with 1's on the diagonal and -a, -b, -c on the diagonal above. Find A^{-1} for this bidiagonal matrix.
- 41 Suppose E_1, E_2, E_3 are 4 by 4 identity matrices, except E_1 has a, b, c in column 1 and E_2 has d, e in column 2 and E_3 has f in column 3 (below the 1's). Multiply $L = E_1 E_2 E_3$ to show that all these nonzeros are copied into L.

 $E_1E_2E_3$ is in the *opposite* order from elimination (because E_3 is acting first). But $E_1E_2E_3 = L$ is in the *correct* order to invert elimination and recover A.
