Homework 10
Due Tuesday, March 7th in class

Read Chs. 6 and 7 of Rovelli.

A few computations to try:

1. A room contains 14 people whose ages are: one person aged 14, one person aged 15, three people aged 16, two people aged 22, two people aged 24, five people aged 25.

   What is the average age of the people in the room?

   What is the spread in age, as measured by the standard deviation?

A question to think about and answer:

2 What does Rovelli mean when he says that our grammar "... is not well-adapted for speaking about the real temporal structure of reality, which is more complex."?
